## VEYHL ENERGY POLICY

**We at Veyhl undertake to assess our products, processes and other activities that have a significant influence on our energy consumption. In order to help us meet this requirement, we have put together a team consisting of appropriately qualified and skilled personnel.**

It is the task of this team to regularly monitor the areas and equipment that consume most energy and/or where there is the greatest potential for reduction of energy consumption.

We intend to constantly monitor and continually improve our energy efficiency. Our objective is to reduce our energy-related outgoings.

We aim to avoid unnecessary use of electrical, heating-related and other forms of energy as the generation, distribution and conversion of this can have significantly detrimental effects on our environment.

We also undertake to reduce our energy-related outgoings to ensure that we remain competitive in the marketplace. For this reason, it is necessary for us to obtain the greatest possible insight on the form of use, distribution and extent of consumption of energy.

We further undertake to review the options for employing alternative and renewable forms of energy where this is possible. We intend to regularly inform our personnel of the ways in which they can actively help to reduce energy consumption and to keep them posted on the latest developments.

We undertake to comply with all existing legal regulations that apply to the use of energy. The implementation of the requirements that necessarily arise as a result will be regularly monitored and evaluated.

The management undertakes to regularly review the suitability of this policy. Our energy policy is being published for the information of our personnel, of our external partners who work for us and other interested third parties.
